### **Edexcel and BTEC Qualifications**

www.mymathscloud.com Edexcel and BTEC qualifications come from Pearson, the world's leading learning company provide a wide range of qualifications including academic, vocational, occupational and speciprogrammes for employers. For further information, please visit our www.edexcel.com.

Our website subject pages hold useful resources, support material and live feeds from our subject advisors giving you access to a portal of information. If you have any subject specific questions about this specification that require the help of a subject specialist, you may find our Ask The Expert email service helpful.

### **General Marking Guidance**

- All candidates must receive the same treatment. Examiners must mark the first candidate in exactly the same way as they mark the last.
- Mark schemes should be applied positively. Candidates must be rewarded for what they have shown they can do rather than penalised for omissions.
- Examiners should mark according to the mark scheme not according to their perception of where the grade boundaries may lie.
- There is no ceiling on achievement. All marks on the mark scheme should be used appropriately.
- All the marks on the mark scheme are designed to be awarded. Examiners should always award full marks if deserved, i.e. if the answer matches the mark scheme. Examiners should also be prepared to award zero marks if the candidate's response is not worthy of credit according to the mark scheme.
- Where some judgement is required, mark schemes will provide the principles by which marks will be awarded and exemplification may be limited.
- When examiners are in doubt regarding the application of the mark scheme to a candidate's response, the team leader must be consulted.
- Crossed out work should be marked UNLESS the candidate has replaced it with an alternative response.

### SOME GENERAL PRINCIPLES FOR CORE MATHS MARKING

(But the particular mark scheme always takes precedence)

### Method mark for solving 3 term quadratic:

Question Number	Scheme
3(b)	Factorising/Solving a quadratic equation is tested in Question 3(b).
	Method mark for solving a 3 term quadratic:
	<b>1. Factorisation</b> $(x^2 + bx + c) = (x + p)(x + q)$ , where $ pq  =  c $ , leading to $x =$ $(ax^2 + bx + c) = (mx \pm p)(nx \pm q)$ , where $ pq  =  c $ and $ mn  =  a $ , leading to $x =$
	<b>2. Formula</b> Attempt to use correct formula (with values for <i>a</i> , <i>b</i> and <i>c</i> .)
	3. Completing the square Solving $x^2 + bx + c = 0$ : $\left(x \pm \frac{b}{2}\right)^2 \pm q \pm c = 0$ , $q \neq 0$ , leading to $x =$

### Use of a formula

Where a method involves using a formula that has been learnt, the advice given in recent examiners' reports is that the formula should be quoted first.

Normal marking procedure is as follows:

<u>Method mark</u> for quoting a correct formula and attempting to use it, even if there are mistakes in the substitution of values (but refer to the mark scheme first... the application of this principle may vary). Where the formula is <u>not</u> quoted, the method mark can be gained by implication from <u>correct</u> working with values, but will be lost if there is any mistake in the working.

### **Answers without working**

The rubric says that these <u>may</u> gain no credit. Individual mark schemes will give details of what happens in particular cases. General policy is that if it could be done "in your head", detailed working would not be required. Most candidates do show working, but there are occasional awkward cases and if the mark scheme does <u>not</u> cover this, please contact your team leader for advice.

### **Misreads**

A misread must be consistent for the whole question to be interpreted as such.

These are not common. In clear cases, please deduct the <u>first</u> 2 A (or B) marks which <u>would have been lost</u> by following the scheme. (Note that 2 marks is the <u>maximum</u> misread penalty, but that misreads which alter the nature or difficulty of the question cannot be treated so generously and it will usually be necessary here to follow the scheme as written).

Sometimes following the scheme as written is more generous to the candidate than applying the misread rule, so in this case use the scheme as written.

If a candidate would otherwise score A0A0 then allow Special Case 1<sup>st</sup> A1 for either SC: 
$$\frac{1}{3} \left[ 1 + \frac{5}{9}x; \dots \right]$$
 or SC:  $\lambda \left[ 1 + \frac{5}{9}x + \frac{25}{54}x^2 + \dots \right]$  or SC:  $\left[ \lambda + \frac{5\lambda}{9}x + \frac{25\lambda}{54}x^2 + \dots \right]$ 

(where  $\lambda$  can be 1 or omitted), with each term in the [.......] is a simplified fraction

SC Special case for the M1 mark

Award Special Case M1 for a correct simplified or un-simplified 
$$1 + n(kx) + \frac{n(n-1)}{2}(kx)$$

Award Special Case M1 for a correct simplified or un-simplified  $1 + n(kx) + \frac{n(n-1)}{2!}(kx)^2$ 

expansion with a value of  $n \neq -\frac{1}{2}$ ,  $n \neq positive integer$  and a consistent (kx). Note that (kx)

must be consistent (on the RHS, not necessarily the LHS) in a candidate's expansion.

**Note** that  $k \neq 1$ .

**Note** Candidates who write 
$$\left\{ \frac{1}{3} \right\} \left[ 1 + \left( -\frac{1}{2} \right) \left( \frac{10x}{9} \right) + \frac{(-\frac{1}{2})(-\frac{3}{2})}{2!} \left( \frac{10x}{9} \right)^2 + \dots \right]$$

where  $k = \frac{10}{9}$  and not  $-\frac{10}{9}$  and achieve  $\frac{1}{3} - \frac{5}{27}x$ ;  $+\frac{25}{162}x^2 + ...$  will get B1B1M1A0A1.

M1 Writes down 
$$(3 + x)$$
 (their part (a) answer, at least 2 of the 3 terms.)

**Note** 
$$(3+x)\left(\frac{1}{4} + \frac{5}{4}x + ...\right)$$
 or  $(3+x)\left(\frac{1}{3} + \frac{5}{27}x + \frac{25}{162}x^2 + ...\right)$  are fine for M1.

This mark can also be implied by candidate multiplying out to find two terms (or coefficients) in x. Note

Multiplies out to give exactly one constant term, exactly 2 terms in x and exactly 2 terms in  $x^2$ . **M1** 

This M1 mark can be implied. You can also ignore  $x^3$  terms. Note

**A1** 
$$1 + \frac{8}{9}x + \frac{35}{54}x^2 + \dots$$

(b)

### Alternative Methods for part (a)

**Alternative method 1:** Candidates can apply an alternative form of the binomial expansion.

$$\left\{ \frac{1}{\sqrt{(9-10x)}} = \right\} (9-10x)^{-\frac{1}{2}} = (9)^{-\frac{1}{2}} + \left(-\frac{1}{2}\right)(9)^{-\frac{3}{2}}(-10x) + \frac{\left(-\frac{1}{2}\right)\left(-\frac{3}{2}\right)}{2!}(9)^{-\frac{5}{2}}(-10x)^2$$

**B1** Writes down 
$$(9-10x)^{-\frac{1}{2}}$$
 or uses power of  $-\frac{1}{2}$ .

**B1** 
$$9^{-\frac{1}{2}}$$
 or  $\frac{1}{3}$ 

Any two of three (un-simplified or simplified) terms correct. **M1** 

**A1** 
$$\frac{1}{3} + \frac{5}{27}x$$

$$\mathbf{A1} \qquad \boxed{\frac{25}{162}x^2}$$

The terms in C need to be evaluated, so  $-\frac{1}{2}C_0(9)^{-\frac{1}{2}} + -\frac{1}{2}C_1(9)^{-\frac{3}{2}}(-10x) + -\frac{1}{2}C_2(9)^{-\frac{5}{2}}(-10x)^2$ Note without further working is B1B0M0A0A0

### **Alternative Method 2: Maclaurin Expansion 1.** (a)

Let 
$$f(x) = \frac{1}{\sqrt{9-10x}}$$

$$\begin{cases} f(x) = 3 & (9 - 10x)^{-\frac{1}{2}} \\ f''(x) = 75(9 - 10x)^{-\frac{5}{2}} \end{cases}$$

$$\frac{5}{2}$$

$$f'(x) = 75(9-10x)^{-2}$$

$$f'(x) = \left(-\frac{1}{2}\right)(9-10x)^{-\frac{3}{2}}(-10)$$

$$\left\{ \therefore f(0) = \frac{1}{3}, f'(0) = \frac{5}{27} \text{ and } f''(0) = \frac{75}{243} = \frac{25}{81} \right\}$$

$$f(x) = \frac{1}{3} + \frac{5}{27}x; + \frac{25}{162}x^2 + \dots$$

$$(9-10x)^{-\frac{1}{2}}$$

		Question 4 Notes  AREFUL! Candidates will assign their own "A, B and C" for this question.
<b>4.</b> (a)	BE C	<b>AREFUL!</b> Candidates will assign <i>their own</i> "A, B and C" for this question.
	<b>B1</b>	At least one of "B" or "C" are correct.
	<b>B1</b>	Breaks up their partial fraction correctly into three terms <b>and</b> both " $B$ " = 25 and " $C$ " = 100.
	Note	If a candidate does not give partial fraction decomposition then:
		• the 2 <sup>nd</sup> B1 mark can follow from a correct identity.
	M1	Writes down <i>a correct identity</i> (although this can be implied) and attempts to find the value of either
		one of "A" or "B" or "C".  This can be achieved by <i>either</i> substituting values into their identity <i>or</i>
		comparing coefficients and solving the resulting equations simultaneously.
	<b>A1</b>	Correct value for "A" which is found using a correct identity and follows from their partial fraction
		decomposition.
	Note	If a candidate does not give partial fraction decomposition then the final A1 mark can be awarded for
		a correct "A" if a candidate writes out their partial fractions at the end.
	NT 4	TI
	Note Note	The correct partial fraction from no working scores B1B1M1A1.  A number of candidates will start this problem by writing out the correct identity and then attempt to
	Note	find "A" or "B" or "C". Therefore the B1 marks can be awarded from this method.
	Note	Award SC B1B0M0A0 for $\frac{25}{x^2(2x+1)} = \frac{B}{x^2} + \frac{C}{(2x+1)}$ leading to "B" = 25 <b>or</b> "C" = 100
		(
(b)	<b>B1</b>	For a correct statement of $\pi \int \left(\frac{5}{x\sqrt{(2x+1)}}\right)^2$ or $\pi \int \frac{25}{x^2(2x+1)}$ . Ignore limits and dx. Can be implied.
	NT 4	
	Note	The $\pi$ can only be recovered later from a correct expression.
		For their partial fraction, (not $\sqrt{\text{their partial fraction}}$ ), where $A, B, C$ are "their" part (a) constants
	M1	Either $\pm \frac{A}{x} \to \pm a \ln x$ or $\pm \frac{B}{x^2} \to \pm b x^{-1}$ or $\frac{C}{(2x+1)} \to \pm c \ln(2x+1)$ .
	1411	$x$ $x^2$ $(2x+1)$
	Note	$\sqrt{\frac{B}{x^2}} \to \frac{\sqrt{B}}{x}$ which integrates to $\sqrt{B} \ln x$ is <b>not</b> worthy of M1.
	Note	$\sqrt{\frac{x^2}{x^2}} \rightarrow \frac{1}{x}$ which integrates to $\sqrt{B}$ in x is <b>not</b> worthly of 1v11.
		At least two terms from any of $A$ and $B$ are $C$
	A1ft	At least two terms from any of $\pm \frac{A}{x}$ or $\pm \frac{B}{x^2}$ or $\frac{C}{(2x+1)}$ correctly integrated. Can be un-simplified.
	A1ft	All 3 terms from $\pm \frac{A}{x}$ , $\pm \frac{B}{x^2}$ and $\frac{C}{(2x+1)}$ correctly integrated. Can be un-simplified.
	Note	The 1 <sup>st</sup> A1 and 2 <sup>nd</sup> A1 marks in part (b) are both follow through accuracy marks.
	dM1	Dependent on the previous M mark.
		Applies limits of 4 and 1 and subtracts the correct way round.
	<b>A1</b>	Final correct <b>exact</b> answer in the form $a + b \ln c$ . i.e. either $\frac{75}{4}\pi + 50\pi \ln \left(\frac{3}{4}\right)$ or $50\pi \ln \left(\frac{3}{4}\right) + \frac{75}{4}\pi$
	711	That correct chart and were in the form $u + v$ and $v$ are closed $u + v$ and $u + v$ an
		or $50\pi \ln\left(\frac{9}{12}\right) + \frac{75}{4}\pi$ or $\frac{75}{4}\pi - 50\pi \ln\left(\frac{4}{3}\right)$ or $\frac{75}{4}\pi + 25\pi \ln\left(\frac{9}{16}\right)$ etc.
		(75, 501, (3))
		Also allow $\pi\left(\frac{75}{4} + 50\ln\left(\frac{3}{4}\right)\right)$ or equivalent.
	Note	A candidate who achieves full marks in (a), but then mixes up the correct constants when writing
		their partial fraction can only achieve a maximum of B1M1A1A0M1A0 in part (b).
	Note	The $\pi$ in the volume formula is only required for the B1 mark and the final A1 mark.

### **4.** (b) Alternative method of integration

$$V = \pi \int_{1}^{4} \left( \frac{5}{x\sqrt{(2x+1)}} \right)^{2} \mathrm{d}x$$

$$V = \pi \int_{1}^{4} \left(\frac{5}{x\sqrt{(2x+1)}}\right)^{2} dx$$

$$\int \frac{25}{x^{2}(2x+1)} dx \; ; \; u = \frac{1}{x} \Rightarrow \frac{du}{dx} = -\frac{1}{x^{2}}$$

$$= \int \frac{-25}{\left(\frac{2}{u}+1\right)} du = \int \frac{-25}{\left(\frac{2+u}{u}\right)} du = \int \frac{-25u}{(2+u)} du = -25 \int \frac{2+u-2}{(2+u)} du$$

$$= -25 \int 1 - \frac{2}{(2+u)} du = -25 (u - 2\ln(2+u))$$

$$\left\{ \int_{1}^{4} \frac{25}{x^{2}(2x+1)} dx = \left[ -25u + 50\ln(2+u) \right]_{1}^{\frac{1}{4}} \right\}$$

$$= \left( -\frac{25}{4} + 50\ln\left(\frac{9}{4}\right) \right) - \left( -25 + 50\ln 3 \right)$$

$$= 50\ln\left(\frac{9}{4}\right) - 50\ln 3 - \frac{25}{4} + 25$$

$$= 50\ln\left(\frac{3}{4}\right) + \frac{75}{4}$$

So,  $V = \frac{75}{4}\pi + 50\pi \ln \left(\frac{3}{4}\right)$ 

**B1** For 
$$\pi \int \left( \frac{5}{x\sqrt{(2x+1)}} \right)^2$$

Ignore limits and dx. Can be implied.

Achieves 
$$\pm \alpha \pm \frac{\beta}{(k+u)}$$
 and integrates to give either  $\pm \alpha u$  or  $\pm \beta \ln(k+u)$ 

## Dependent on the M mark. Either -25u or $50\ln(2+u)$

 $-25 (u - 2 \ln(2 + u))$ **A1** 

Applies limits of  $\frac{1}{4}$  and 1 in u or 4 and 1 in x dM1 in their integrated function and subtracts the correct way round.

A1  $\left[ \frac{75}{4}\pi + 50\pi \ln \left( \frac{3}{4} \right) \text{ or allow } \pi \left( \frac{75}{4} + 50 \ln \left( \frac{3}{4} \right) \right) \right]$

	1 <sup>st</sup> M1	Sets their $\frac{dy}{dx} = -\frac{1}{2}$
	1st A1	Rearranges to give the correct equation with $\sin t$ and $\cos t$ on the same side.
		eg. $4\sin t - 4\cos t = -1$ or $4\cos t - 4\sin t = 1$ or $\sin t - \cos t = -\frac{1}{4}$ or $\cos t - \sin t = \frac{1}{4}$
		or $4\sin t - 4\cos t + 1 = 0$ or $4\cos t - 4\sin t - 1 = 0$ or $\sin t - \cos t + \frac{1}{4} = 0$ etc. are fine for A1.
	2 <sup>nd</sup> M1	Rewrites $\pm \lambda \sin t \pm \mu \cos t$ in the form of either $R\cos(t \pm \alpha)$ or $R\sin(t \pm \alpha)$ where $R \neq 1$ or 0 and $\alpha \neq 0$
	2 <sup>nd</sup> A1	Correct equation. Eg. $4\sqrt{2}\sin\left(t-\frac{\pi}{4}\right) = -1$ or $-4\sqrt{2}\cos\left(t+\frac{\pi}{4}\right) = -1$
		or $\sqrt{2}\sin\left(t-\frac{\pi}{4}\right) = -\frac{1}{4}$ or $\sqrt{2}\cos\left(t+\frac{\pi}{4}\right) = \frac{1}{4}$ , etc.
	Note	Unless recovered, give A0 for $4\sqrt{2}\sin(t-45^\circ)=-1$ or $-4\sqrt{2}\cos(t+45^\circ)=-1$ , etc.
	3 <sup>rd</sup> M1 4 <sup>th</sup> A1	which is dependent on the $2^{nd}$ M1 mark. Uses correct algebraic processes to give $t =$ anything that rounds to 0.6077
	Note	<b>Do not give</b> the final A1 mark in (c) if there any extra solutions given in the range $-\frac{2\pi}{3} \leqslant t \leqslant \frac{2\pi}{3}$ .
	Note	You can give the final A1 mark in (c) if extra solutions are given outside of $-\frac{2\pi}{3} \leqslant t \leqslant \frac{2\pi}{3}$ .
