CALCULUS BC
SECTION II, Part A

Time—45 minutes

Number of problems—3

A graphing calculator is required for some problems or parts of problems.

Work for problem 1(a)

$$\int_0^{30} [82 + 4\sin(\frac{t}{2})] dt \approx 2474 \text{ cars}$$

2474 cars pass through over the 30-minute period.

Work for problem 1(b)

$$F(t) = 82 + 4\sin(\frac{t}{2})$$

$$F'(t) = 4 \cdot \frac{1}{2} \cdot \cos(\frac{t}{2})$$

$$= 2\cos(\frac{t}{2})$$

$$F'(7) = 2\cos(\frac{7}{2}) = -1.8729$$

Since the derivative of $F(t)$ is negative,
the traffic flow is decreasing.

$g(x)$ has a local maximum where $g'(x)$ is zero or where $g'(x)$ is undefined, and where $g'(x)$ changes sign from positive to negative. This occurs only at $x = 3$, where $g'(x) = 0$ and changes from positive to negative. [at $x = 1$, $g'(x)$ does not experience a sign change; at $x = -4$, $g'(x)$ changes from negative to positive, a local minimum]

Continue problem 5 on page 13.

Work for problem 5(c) abs min on $[-5, 4]$

There is a local min at $x = -4$ because $g'(x)$ is equal to zero on $g(x)$ and changes from negative to positive.

$$g(-4) = \int_{-3}^{-4} f(t) dt = -\int_{-4}^{-3} f(t) dt = -\left[\frac{1}{2}(2+1)(3) + \frac{1}{2}(1)(2)\right] = -\left[\frac{9}{2} + 1\right] = -\frac{11}{2} = -5.5$$

$$g(-4) = -\frac{11}{2}$$

The absolute minimum of g on $[-5, 4]$ is at $x = -4$ because $g'(x) = 0$ at $x = -4$ & changes from negative to positive. Also, the endpoints' values on g are bigger than the value of $g(-4)$.

ENDPOINT CHECK

$$g(-5) = \int_3^{-5} f(t) dt = -\int_5^{-3} f(t) dt = -\left[\frac{1}{2}(2+1)(3) + \frac{1}{2}(1)(2) - 1\left(2 \times \frac{1}{2}\right)\right] = -\left[\frac{11}{2} - 1\right] = -\frac{9}{2} = -4.5$$

$$g(-5) = -\frac{9}{2} > -\frac{11}{2}$$

$$g(4) = \int_{-3}^4 f(t) dt = \frac{1}{2}(2+1)(3) + [(1)(2) - (\pi)(1^2 \times \frac{1}{2})] + (1)(1)\left(\frac{1}{2}\right) - 1(1)\left(\frac{1}{2}\right) = \frac{9}{2} + \left[2 - \frac{\pi}{2}\right] + 0 = \frac{9}{2} + 2 - \frac{\pi}{2} = \frac{13}{2} - \frac{\pi}{2} \approx 6.5 - 1.57 \rightarrow \text{positive}$$

PI's ^{on $g(x)$} at $x = -3, 2,$ and $x = 1$.

g has a point of inflection (PI) where $g'(x)$ is zero or undefined & changes signs. ~~where $g''(x)$ equals zero~~ $g''(x)$ equals zero and changes signs at $x = 1$, where $g'(x)$ is a local min. $g''(x)$ is undefined and changes signs at $x = -3$ and $x = 2$ (even though $g''(x)$ is undefined at $x = 0$, $g'(x)$ doesn't change signs there) — These are local max's.

The College Board is a not-for-profit membership association whose mission is to connect students to college success and opportunity. Founded in 1900, the association is composed of more than 4,500 schools, colleges, universities, and other educational organizations. Each year, the College Board serves over three million students and their parents, 23,000 high schools, and 3,500 colleges through major programs and services in college admissions, guidance, assessment, financial aid, enrollment, and teaching and learning. Among its best-known programs are the SAT[®], the PSAT/NMSQT[®], and the Advanced Placement Program[®] (AP[®]). The College Board is committed to the principles of excellence and equity, and that commitment is embodied in all of its programs, services, activities, and concerns.
